PARKING MANAGEMENT FOR ONE OF THE LEADING CONSTRUCTION COMPANIES IN SWITZERLAND

Case Study

PROBLEM FACED

- The client was facing a unique hardware problem. While they limited entry to their parking premise to only employees with parking access cards, multiple cards had already been issued, leading to a commotion.

- Employees would have to inform daily before coming to the office. The guard would also have to manually track whether an employee had announced their intention to come to the office or not.

  This entry system was not working for the client. The hardware only supported one-way communication, i.e., it could only receive information but not send anything.

SOLUTION PROVIDED

The client reached out to WorkInSync to streamline and automate their parking process. WorkInSync's parking management software allowed the employees to create a booking in advance.

We created an API that integrated with their hardware system. As a result, we could easily access the booking data on the dashboard. This also enabled the client to check if a booking was made using the access card, based on which entry to the office was allowed or rejected.

RESULTS

No manual checking was required at the gate

The time taken for a vehicle to enter the office premise was significantly reduced
